REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance: The closest prior art, JP-08-165357, teaches stretched films comprising cycloolefin copolymer or in a blend with a polyolefin. They teach that multilayer structures can be produce, but the examples are limited to monolayer films. The monolayer films have very high Elastic Modulus (Young's Modulus) .

Example 1, 385,030 lb/in²

Example 2 284,466 lb/ in²

Example 3 312,913 lb/ in²

Each of the values is well above the 50,000 to 200,000 lb/ in² value claimed.

While one might argue that the addition of the two outer layers will lower the Elastic Modulus of the film, it would be directly related to the choice of polyolefin since this value would be directly related to the density and comonomer content of the layers.

The applicants are also using polymers having a glass transition temperature from 25 to 45 deg. C and this is far lower than the glass transition temperatures taught in the Japanese reference. This not only makes the claims, which specifically recite this limitation allowable, but also provides a reason for not arguing "inherency" for the other claims. An argument of "inherent" properties is only valid when the materials really are the same or substantially similar. The difference in glass transition temperatures will have ramifications on all the properties claimed as it affects the temperature at which the film can be oriented.

While much of the claimed structure is taught by JP-08-165357, there are sufficient differences between the materials claimed and those used in the prior art, that the claimed films are neither anticipated nor obvious over JP-08-165357.
